

AI and Data Science Learning Path

A safe learning sequence

1. Learn Python, data types, and basic statistics.
2. Clean and visualise a small dataset.
3. Understand training, validation, and test data.
4. Measure accuracy and investigate bias or missing data.
5. Explain the result in plain language before sharing it.

Practice challenge

Choose a public dataset and write three questions before writing a model.

NIVOX tip: a simple, explainable baseline is better than an impressive mystery model.
